

DURACON Software - Guidelines

- (1) The DURACON Software includes two files, of which one is the software *Duracon (2.3)*, while the other is a data file *data23_me*, giving an example on input data. This data file can be edited and used as a basis for input of new data.
- (2) The data file is stored as *filename_me.dat*, for example *data23_me.dat*
- (3) When the software file is opened, a question about job name appears: *Job name?* Here, the data file *filename_me* is used as input, for example *data23_me*
- (4) As a result of the running, two Exel-files are generated:
 - *Filename_me_rs*, for example *data23_me_rs* which includes all input data; a table showing the probability of corrosion (%) as function of time for each individual simulation
 - *Filname_me_xls*, for example *data23_me_xls*
- (5) All results can be further treated in Exel in order to give proper presentations.
